Description

When using a style template the adviced way of using that in reports is by setting it as "com.servoy.plugins.jasperreports.JasperReportsResourceLoader.loadStyle("style.jrtx")". However, when developing the report the style cannot be found because Jasper Studio doesn't recognizes that. So, another way is just to define it as "style.jrtx". But when running the report, the plugin cannot find the style template in the folder as defined in setting "directories.jasper.extra".
