Try the new version 3.5.76 - I've added request.remoteAddress, request.remoteHost, request.remoteUser  
They will be filled IF available.

remoteAddress might be the address of a proxy if you are using one, in which case you will need to examine the request.headers to check if the proxy exposes the remote address (via a X-FORWARD-FOR for example)

remoteHost in most case will be = remoteAddress (except if you configure the app server to use reverse DNS to try and resolve the remote IP to a host)

remoteUser will be null in most cases unless you are using BASIC authentication where the app server might expose the user (depends on the java app server and configuration)
