Hi Marcel,

my whole solution breaks because of this missing piece: `plugins.it2be_tools.server().getApplicationServerDir()`

I use it everywhere in my solution to point to the right folder, in this case to an ireport folder: `plugins.jasperPluginRMI.reportDirectory = plugins.it2be_tools.server().getApplicationServerDir() + '/server/webapps/ROOT/reports/'`

And far as I know, this is the only way , to tell the jasper-plugin serverside, where the report files are...
I believe, Servoy warned for security issues, and allow certain actions ONLY when users are logged in!!

The trouble is I can't roll back to an older version, because I had to update to the latest Word version and it auto-updated the tools plugin also.....

So I really hope, there is some solution to this.....

Why don't you use the jasper report server plugin property "directory.jasper.report" to set that path?
The client should not need to know about the server path.

Because with every deployment I have to set this by hand in the servoy-admin page.

And I fiddled around with it, and could'nt find a reliable way todo this relative.....

With this code I don't have to think about it, my report folder is always relative to the ROOT.
