

JSListPicker module - Feature #495

Is it possible to search on columns that are one table away from the columns set up in the global list picker method?

Yes you can search over Servoy relationships on related tables. Even more than one table away. Just pass the relationshipname.columnname as a string and this should work. Of course all the Servoy rules apply here so searching on non-stored data (unstored-calcs) is not supported.

I thought I was passing "the relationshipname.columnname as a string" like this:

```
_oCL.dataprovider = "qs_projects_to_qs_quotes.csono";
```

#3 - 04/18/2012 11:17 PM - Robert Ivens

That is correct. You say that isn't working ?

#4 - 04/18/2012 11:46 PM - John Michael Parkan

See the screen shots below... the list picker doesn't see to be picking up the available csono (first column) when being called and searching doesn't find anything though the relation.

Here is what the console throws:

Your JSListPicker instance has the following issue(s):

- There is no callback properties set. You need to add a callback method OR a callback form and column/variable

Your JSListPicker instance has the following issue(s):

I took a cursory look at what it was trying to do but I couldn't really follow the code at first glance.

I am pretty sure you are seeing 2 different things here. When you get these messages in the console then the listpicker will not show at all so your screenshots are from other code.
