

JSListPicker module - Defect #502

List Picker doesn't seem to listen to: `_oLP.form.width = 800;`

Description			
It seems like there is a bug in the list picker where it doesn't listen to setting the size of the list picker.			
I have various list pickers of different sizes and when a smaller <code>_oLP.form.width</code> is called, then a larger one, the form does not resize.			

History

#1 - 05/03/2012 12:01 AM - John Michael Parkan

It's not using a show form in dialog, but I found this little tidbit: Show the specified form in a dialog. (NOTE: x, y, width, height are initial bounds - applied only the first time a dialog is shown)

Could that be the issue here?

#2 - 05/03/2012 12:06 PM - Robert Ivens

- Status changed from New to Feedback

That might be the case here. You should name your listpickers (the name property) uniquely so that each window object uses its own instance. If you use the same name everywhere then the same window instance is used.

#3 - 06/30/2012 08:47 PM - Robert Ivens

Do you still see this behavior even if you have different window names ?

#4 - 06/30/2012 09:44 PM - John Michael Parkan

No, it works perfectly when I have different window names using the `.name` property.

#5 - 06/30/2012 09:58 PM - Robert Ivens

- Status changed from Feedback to Rejected

Okay, then I consider this ticket closed.

The JSListpicker doesn't know if a dialogname was used before and what its dimensions were. Consider this a Servoy gotcha/limitation/by design thing.

#6 - 06/30/2012 10:38 PM - John Michael Parkan

So what is the work around to use `.width` properties differing lengths?

#7 - 06/30/2012 10:44 PM - Robert Ivens

You use a different (unique) dialog name. This is just an internal name, the window title is something completely different.
