Description

Hi,
it would be nice to be able to set an input format on a column in the treeview.
For example the user should only be allowed to input numbers in a special column.
What i do right now is to concert the new value into a number, so all the other characters are gone.
But i would prefer to have the property of an input format.
Thanks
Ina

Hi Christina,
Would suggest to customize *onEditFinished* method in Servoy project.
With accepted arguments in *onEditFinished*, you can determine the cell that's been edited and validate the value.
If value is not in proper format, clear it out and show dialog as a hint how to fill it properly, for example

Regards

I already have customized the *onEditFinished* method.
As arguments I am using `nodeID, xy, value`.
I am converting the value to a number. That works fine.
But what i really want is not to have to convert the string to a number. The user should only be allowed to put in a number. He is able to type in letters, what doesn't make sense in this case. So it would be nice to have an input format for the textfield.
