Description	
<p>Hi, as in your example the user is able to move through the nodes via arrow up and arrow down. He can finish editing a node with the return / enter click. It would be nice when the user would be able to start editing a cell with clicking return / enter. I know that it is a problem when there are more editable columns (I only have one). But perhaps you could tell the bean, wich column should be editet when clicking return.</p> <p>My next question is about a bug (I think so). When the user clicks the right / left arrow to expand / collaps nodes he isn't able anymore to move through the nodes via arrow up and arrow down.</p> <p>Thanks! Ina</p>
