### Description

As it is right now, there are no caching related headers sent to the client for static resources that are defined in the config.json. The effect of this is that browsers must request all the defined static files for a page with each page load, and never caching them locally. It would be useful if velocity could return a Last-Modified header set to the file's local modified timestamp so browsers could do conditional gets (If-Modified-Since) to save on file transfer/load times.

## History

That's a very good idea indeed. I'll look into adding that for the next version.
Thanks!
