Description

In the context object I add some objects with images, something like this:

```
vContext = {}  
vContext.objects = {}  
  
for(i = 1; i < size; i++){  
    vContext.objects[data[i].name] = {}  
    vContext.objects[data[i].name].name = data[i].name  
    vContext.objects[data[i].name].image = data[i].image  
}
```

Then when I get the PDF it seems that images are lost. Like the object hadn't "image" property.

I attach the sample solution and report with some modifications to test it (the modifications in the report are after Products).

It works ok in the 3.0 version.
