Description	
<p>Hi might it be possible to offer a multi line input dialog that shows more than one line automatically if the initialValue has line breaks in it?? (e.g. I want my users to be able to edit some email body text before sending an email, but the text is on multiple lines & when I show it in the globals.DIALOGS.showInputDialog(title, message, initialValue), everything is stuck in one line so is difficult to edit) I know I could create a special form to display in a globals.DIALOGS.showFormInModalDialog, but doing this is more flexible ... Maybe another parameter could be added to globals.DIALOGS.showInputDialog(title, message, initialValue), like globals.DIALOGS.showInputDialog(title, message, initialValue, showMultiLine) ?? Thanks Rafi</p>

The problem is that this option is totally different from what the smart-client does.
My recommendation would be to create you own form for that.
Than you are totally in control.

agree?
