Target version:				
Browser (if web client):	IE and Chrome			

Description

The servoy treeview bean scrolls to the top after expanding a node end refreshing the tree.
This occurs after a node has been expanded, after scrolling down in the tree to a node located in the bottom part of the tree (which initially is located under the active area of the tree).
The tree doesn't holds its position to the expanded node but scrolls up. So you manually have to scroll down again to the expanded node.

Happens in the webclient using IE and Chrome. In Firefox however it (correctly) does keep (goes back to) the position of the expande node.

Both in servoy developer and regular application server.
